Magnetic bits on Hard Disk Drive

Co-based hard disk media : bits 50nm and below

B. C. Stipe, Nature Photon. 4, 484 (2010)

Underlying microstructure

S. Takenoiri, J. Magn. Magn. Mater. 321, 562 (2009)

Gains in areal density

↪ Compromise : time stability, writability, readability
↪ Relies on progress of technology and science

↪ Growth rate is seriously slowing down
↪ Major bottlenecks ahead
↪ Any 2D-based storage design will sooner or later face a limit in areal density, imposed by fundamental bottlenecks

Facts

- ⇒ Incremental (multilevel patterning) however already 'quite 3D'
- ⇒ Technological node unchanged
- ⇒ $1\text{Gb/mm}^2 \rightarrow 600\text{Gb/in}^2 \dots$

IEEE JOURNAL OF SOLID-STATE CIRCUITS, VOL. 50, NO. 1, JANUARY 2015

Proposal for a race-track memory in 3D

S. S. P. Parkin, Science 320, 190 (2008)
Scientific American, June, 76 (2009)
+ patents (IBM)

Pros

- ↪ Incremental progress made again possible along the depth
- ↪ One read/write cell per wire
→ cost remains moderate

Cons

- ↪ Fabrication is technologically challenging
- ↪ In-depth inspection of devices difficult

Logic (Field driven)

D. A. Allwood et al., Science 309, 1688 (2005)

Memory (current-driven)

L. Thomas et al., IEEE International Electron Devices meeting (2011)

↪ Is time ripe to go back to 3D proposals ?

↪ What are the technological bottlenecks ?

↪ What new science may be made along the road ?

1. Introduction

2. [Science]

Why addressing cylindrical magnetic nanowires ?

3. Nucleating domain walls

4. 3D identification of domain walls

5. Move domain walls

Transverse versus vortex wall

Thin and narrow strips

Thick and large strips

Transition for: $tW \approx 75 \Delta_d^2$

Magnetic Force Microscopy

R. McMichael & M. Donahue,
IEEE Trans. Mag. 33, 4167 (1997)

Y. Nakatani et al., J. Magn. Magn. Mater.
290-291, 750 (2005)

Experimentally well established

Transverse wall $D \lesssim 7\Delta_d$

Bloch-point wall $D \gtrsim 7\Delta_d$

H. Forster et al., J. Appl. Phys. 91, 6914 (2002)

A. Thiaville, Y Nakatani / B. Hillebrands, A. Thiaville (ed.),
Spin dynamics in confined magnetic structures III, 101, 161-206 (2006)

Sometimes improperly named vortex walls

What is a Bloch-point ?

A magnetic texture with local
cancellation of the magnetization vector

R. Feldkeller,
Z. Angew. Physik 19, 530 (1965)

W. Döring,
J. Appl. Phys. 39, 1006 (1968)

LLG equation

$$\frac{d\mathbf{m}}{dt} = \gamma_0 \mathbf{m} \times \mathbf{H} + \alpha \mathbf{m} \times \frac{d\mathbf{m}}{dt} \quad \gamma_0 < 0$$

Once-only 'Walker' field for switching the orthoradial circulation

A. Thiaville et al., in *Spin dynamics in confined magnetic structures III*, p.161-206 (2006)

- ↪ Once-only 'Walker' process for the circulation
- ↪ Right-hand rule : DW direction of motion vs circulation
- ↪ Same physics predicted (later) for nanotubes

Domain walls in one-dimensional systems

↪ Transverse and vortex walls share the same topology

↪ Bloch-point domain walls are of a different class
→ Topological protection

↪ Need to characterize 3D magnetization textures

Strips and transverse walls

- ⇒ Theory and experiments
- ⇒ Domain-wall transformation
- ⇒ Walker limit, low speed ($\sim 100\text{m/s}$)

BPW in wires

- ⇒ Theory predictions ; no experiments
- ⇒ No domain-wall transformation
- ⇒ High speed expected ($> 1\text{ km/s}$)

A. Thiaville et al., in Spin dynamics in confined magnetic structures III, p.161-206 (2006)

1. Introduction

2. [Science]

Why addressing cylindrical magnetic nanowires ?

3. Nucleate domain walls

4. 3D identification of domain walls

5. Move domain wall

The basics

Anodization of aluminum → template

H. Masuda, *Science* **268**, 1466-1468 (1995)

Electroplating → magnetic nanowires

100nm

⇒ Simple metals and alloys :

Co, Ni,

$\text{Fe}_{20}\text{Ni}_{80}$

$\text{Co}_{20}\text{Ni}_{80}$

Specific aspects

ALD to reduce pore diameter

S. Da Col et al., *Appl. Phys. Lett.* **98**, 112501 (2011) ⇒ Control pitch vs diameter

Modulation of pore diameter

S. Allende et al., *PRB* **80**, 174402 (2009)

⇒ Landscape for domain walls

Preparation

- ⇒ Alumina matrix dissolved
- ⇒ Solution blown on surface

Nucleation

⇒ Step 1 : wire magnetized along the bends radii

⇒ At remanence, head-to-head and tail-to-tail domain walls at the bends

NB : similar to procedure for flat stripes : **T. Taniyama, Phys. Rev. Lett. 82, 2780 (1999)**

Note recent result on 3D wires (EBID) : **A. Fernandez-Pacheco, Sci. Rep. 3, 1 (2013)**

Principle

- ⇒ Provides energy landscape for domain walls
- ⇒ NB : reports with modulations however no domain walls

K. Pitzschel et al., J. Appl. Phys. 109, 033907 (2011)

Nucleation of domain walls

⇒ Protrusions create a 'box' for domain walls

1. Introduction

2. [Science]

Why addressing cylindrical magnetic nanowires ?

3. Nucleate domain walls

4. 3D identification of domain walls

S. Jamet et al., arXiv:1506.02866

5. Move domain walls

XMCD

X-ray Magnetic Circular Dichroism

⇒ Element selectivity

Courtesy:
W. Kuch

⇒ Magnetic sensitivity

PEEM

Photo-Emission Electron Microscopy

Features

- ⇒ Synchrotron-based technique
- ⇒ Secondary electrons → surface sensitive
- ⇒ Spatial resolution : 25nm

Two examples

Beam along wire

⇒ Locate domain walls

Beam across wire

⇒ Inspect domain wall

⇒ Several non-trivial patterns

⇒ Need for modelling

Schematics

$$\frac{dI_{X,\sigma\pm}}{d\ell} = - \left[\frac{1}{2}\mu_+(1 \pm \hat{\mathbf{k}} \cdot \mathbf{m}) + \frac{1}{2}\mu_-(1 \mp \hat{\mathbf{k}} \cdot \mathbf{m}) \right] I_{X,\sigma\pm}$$

- ⇒ Above wire : surface magnetization
- ⇒ In the shadow : volume magnetization
- ⇒ Non-linear, even change of sign

Simulation of XMCD

Resulting image

- ↪ Surface and volume information
- ↪ Bloch-point domain wall identified from symmetry and volume curling
- ↪ Enhanced spatial resolution

S. Jamet et al., arXiv:1506.02866

Bloch-Point Wall (BPW)

Wire diameter : 95nm

Experiment

Simulation

⇒ Orthoradial curling

⇒ Symmetry with respect to plane perpendicular to axis

Transverse Wall (TW)

Wire diameter : 70nm

Experiment

Simulation

⇒ Loss of symmetry with respect to plane perpendicular to axis

N. Bizières et al., Nanolett. 13, 2053 (2013)

→ Transverse wall imaged with electron holography

S. Da-Col et al., Phys. Rev. B (R) 89, 180405, (2014) arXiv:1311.7368

Imaging curved surfaces : specific features

- ⇒ Sample is part of the optics
- ⇒ Enlarged size of the direct image
- ⇒ Different focus settings on sample and supporting surface, despite large depth of focus

Example

Focus on background

Focus on wire

- ⇒ Sets sharpness and contrast

S. Jamet et al., arXiv:1506.02866

Determine the proper edge energy

- ⇒ Slight oxidation of Fe at the surface
- ⇒ Tune the energy in the background to optimize the dichroic contrast

S. Jamet et al., arXiv:1506.02866

Chose the edge for best contrast (?)

Table I: Absorption coefficients μ at the different absorption edges. Figures for pure elements are derived from [21]

Edge	μ (nm ⁻¹)	Fe	Ni	Fe ₂₀ Ni ₈₀
Fe L2	μ_-	0.03	≈ 0	0.006
	μ_+	0.04	≈ 0	0.008
Fe L3	μ_-	0.09	≈ 0	0.018
	μ_+	0.05	≈ 0	0.010
Ni L2	μ_-	0.017	0.017	0.017
	μ_+	0.017	0.021	0.020
Ni L3	μ_-	0.017	0.053	0.046
	μ_+	0.017	0.040	0.035

⇒ Fe₂₀Ni₈₀ : expect same contrast at Fe and Ni edges

- ⇒ Lower contrast at Ni edges
- ⇒ Surface / shadow ratio is changed

Effects

- Background level in microscope
- ⇒ Is NOT the camera background
- ⇒ Not affected by field or contrast apertures
- ⇒ Reason ?..

Consequences

- ⇒ Reduction of XMCD contrast
- ⇒ Sharper reduction in the shadow (less counts)
- ⇒ Need for correction of background

Background correction

$$I_{\text{XMCD},0} = (I_{e,\sigma_-} - I_{e,\sigma_+}) / (I_{e,\sigma_-} + I_{e,\sigma_+} - 2I_{e,b})$$

- ⇒ Measure background in deep shadows
- ⇒ Subtract background

S. Jamet et al., arXiv:1506.02866

Principle

Raw

Corrected

Implementation

Raw

Corrected

S. Jamet et al., arXiv:1506.02866

Physics

→ Workfunction influences ratio of direct versus shadow

Consequence

→ Affects the dichroic signal due to the background level

S. Jamet et al., arXiv:1506.02866

XMCD-PEEM

- ⇒ Probes magnetization along beam
- ⇒ Provides both surface (sensitivity) and volume information
- ⇒ Enhanced spatial resolution along the beam direction

(S)TXM

- ⇒ Probes magnetization along beam
- ⇒ Several components of magnetization through sample tilt
- ⇒ Compatible with applied fields

Lorentz / Holography

- ⇒ Probes magnetization perp to beam
- ⇒ Higher spatial resolution
- ⇒ Compatible with applied fields

Frontiers

- ⇒ Image processing (knowledge of microscope physics)
- ⇒ Quantitative analysis
- ⇒ Towards vectorial tomography

1. Introduction

2. [Science]

Why addressing cylindrical magnetic nanowires ?

3. Nucleate domain walls

4. 3D identification of domain walls (back to physics)

5. Move domain walls

Topology of the transverse — vortex wall family

Square side : 30nm

Square side : 44nm

Transverse and vortex walls share topology

May be shortened to 'vortex' or 'transverse' if dominating feature

Do not use 'vortex' for 'Bloch-point'

Review chapter : S. Jamet et al., in Magnetic Nano- and Microwires: Design, synthesis, properties and applications, M. Vázquez Ed., Woodhead, in press. (arXiv:1412.0679)

Circulation of magnetization → Quantify curling

Second-order transition for $D \approx 7\Delta_d$

Imaging the general character of curling

Motivation :

Provide a unified picture of domain walls in (nearly) one-dimensional systems

Flat strips

⇒ Transverse and vortex

Cylindrical wires

⇒ Transverse and Bloch-point walls

⇒ Confusion between Bloch-point and vortex

Emergence of square or rectangular wires

⇒ Top-down + bottom-up / Planar templates

P. Sergelius et al., *Nanotech.* **25**,504002 (2014)

Open issues

- ⇒ Span strips to wires
- ⇒ Clear and simple classification
- ⇒ May Bloch-point walls be found in rectangular wires ?

Analytics and simulations

↪ Extensive coverage of the width/thickness space

↪ Bloch-point walls should exist away from disk or square cross-section

Review chapter : S. Jamet et al., in **Magnetic Nano- and Microwires: Design, synthesis, properties and applications**, M. Vázquez Ed., Woodhead, in press. (arXiv:1412.0679)

1. Introduction

2. [Science]

Why addressing cylindrical magnetic nanowires ?

3. Nucleate domain walls

4. Identify domain walls

5. Move domain walls

Experiments

S. Da-Col et al., in preparation

↪ Domain-wall motion demonstrated (range 1-10mT)
↪ Pinning at modulations of diameter

Straight sections

⇒ Distribution of propagation fields, range 1-10mT

⇒ Similar to the case of strips
J. Sampaio et al., J. Appl. Phys. (2013)

Protrusions and constrictions

⇒ Pinning field ~30mT

Structure

Focus on wire

Focus on shadow

Motion and circulation

Initialize

Field pulse

Final state

Bloch-Point walls with same circulation

➡ **Confirmation : selection of circulation with once-only Walker switch (preliminary)**
